There can be few modern feats of engineering achievement that surpass the great pyramids of Ancient Egypt. The sheer scale of the technological and physical challenge facing the creators of these superstructures was immense. The management skills demanded of those early engineers were equally impressive. The desires of the customers (the Pharaohs) had to be fulfilled while co-ordinating, controlling and monitoring the subcontractors (the artisans) and the employees (the slaves), as well as ensuring the optimum use of material resource. The pace of change within telecommunications, measured in terms of technology and the opening up of markets to competition, has continued steadily since the highly acclaimed first edition of the Telecommunications Engineer's Reference Book was published. To keep up with all these changes this second edition has been extensively revised, and seven completely new chapters added. The book maintains a balance between new developments and established technologies since telecommunications systems, once in the network, represent a substantial investment which tends to be maintained for a relatively long time. New operators have the advantage of being able to use the latest technologies when building their new networks. The book is structured in five parts. Part 1 introduces mathematical techniques which are required for the analysis of telecommunications systems. Part 2 deals with the physical environment of telecommunications. Part 3 describes various components used within telecommunication systems, both wireline and wireless. Part 4 covers fundamental telecommunication topics. Part 5 describes telecommunication applications and represents the largest section of the book. The topics have been selected and grouped in order to cover all the major areas within telecommunications, spanning the field of transmission and switching, the transmission media being copper, fibre optic or wireless. The 75 international authors who have contributed to the book are all specialists in their own field, working in organisations that are in the forefront of the technology concerned in Europe, Japan, Canada and the USA. Fraidoon Mazda has done an excellent job in pulling all these contributions together to create an ongoing reference work which will be invaluable to anyone working in the growing field of telecommunications. New sections are now included on the following subjects: Trigonometric and General Formulae Calculus Series and Transforms Matrices and Determinants Fibre Optic Communications Cable Television and Telephony The Internet an international reference source fully updated everything for the telecommunications professional in one, handy source
