The linearized model $P = B \cdot V$ can be interpreted as the model for a network of resistors fed by dc current sources where P is the vector of nodal current injections, V is the nodal vector of dc voltages, and B is the nodal conductance matrix, as illustrated in Figure 6.8.

Solutions matrices that are useful in power system network analysis are discussed. The element to node incidence matrix has a dimension of $e \times n$ where e and n are the number of elements and nodes, respectively. The bus incidence matrix has $e(n-1)$ dimension since one node becomes reference. The branch-path incidence matrix relates branches to paths.
